Maximizing Fresh Fruit & Vegetable Quality

Mark Ritenour
University of Florida
Indian River Research and Education Center
Preharvest Factors Affecting Harvest & Quality

- Preharvest Factors
  - Genetics
    - Tree size – e.g. dwarf vs. full sized.
    - Uniformity of crop – e.g. harvest one time or spot pick / harvest multiple times.
    - Ease of separating product from plant – e.g. maturity, abscission zone formation, etc.
    - Product location on the tree – e.g. inner vs. outer canopy.
Preharvest Factors (continued)

- **Weather Conditions**
  - Rainfall.
    - Too much: increased decay, blue albedo, zebra skin, diluted sugars, etc.
    - Not enough: poor size, wilting, increased plugging, concentrated sugars, etc.
  - Dew on the crop.
    - E.g. oil spotting.

http://alexjonesphoto.com/recent/archive/rainycitrus.jpg
Preharvest Factors (continued)

- **Weather Conditions** (continued)
  - Temperature.
    - E.g. chilling or high temperature injury, color change, shape (sheepnose), etc.
  - Wind.
    - E.g. wind scarring, sand damage, spread of dirt & spores.
Preharvest Factors (continued)

- **Weather Conditions**
  - Light.
  - E.g. effects on photosynthesis & temperature.

Fig. 2. Effect of direction of exposure and amount of shading on per cent soluble solids content of Valencia oranges.
Preharvest Factors (continued)

- **Weather Conditions** (continued)
  - Light.
    - E.g. effects on photosynthesis & temperature.

*Fig. 4. Color of the rind of Valencia oranges affected by the amount of shading. The length of the bar indicates the percentage of total fruit represented in each light class.*
Time of Day

- **Temperature.**
  - High temperatures increase cooling demand. Possible use of night harvesting.
  - Chilling susceptibility may change throughout the day.

- **Dew on the crop.** (e.g. oil spotting in citrus)

- **Food supply within product** (e.g. photosynthate reserves in flowers).
Preharvest Factors (continued)

- **Cultural Practices**
  
  - Use of chemicals – e.g.:
    - Ethylene releasing chemicals (Ethephon), Abscission inhibitors, pesticides.
  
  - Irrigation
  - Nutrition
  - Pruning
  - Planting densities
  - Cover crops/plastic mulches
    - Can affect crop maturity, color, insect damage, etc.
When to Harvest?

- Are minimum maturity standards met?
- Harvest time is usually a compromise between:
  - Maximum quality
  - The commodity’s ability to survive the marketing chain
When to Harvest?

• Economics
  - Is there a market for the crop? If not,
    - Can the crop be harvested & stored until there is a market?
    - Leave the crop unharvested?

• Supplies, labor, packing & storage facilities, etc. available to harvest & process the crop?
Harvesting

• Fruit often are can naturally detach from a plant through the formation of an abscission zone.
  • May accelerate or delay abscission by the use of growth regulators e.g.:  
    • Ethephon (ethylene)  
    • Ethylene inhibitors (e.g. Retain=AVG)  
• Most vegetables usually do not have an abscission zone.

From: http://botit.botany.wisc.edu/
Harvesting

- Often the most traumatic time of a commodity’s life.
  - Detachment from “food” and water.
  - Force required to remove the commodity.
    - Fingernail marks, finger pressure.
  - Drops/impacts onto branches, harvesting bags, buckets, bins, trailers, other fruit etc.
  - Vibrations during transport on dirt/rough roads.
Field vs. Packinghouse Packing

- Field Packing (e.g. strawberries, head lettuce, grapes)
  - Less material to transport and dispose.
  - Fewer handling steps => less mechanical damage.
  - Smaller initial start-up cost.
  - Requires large machinery in the field (soil compaction, trampled product, etc.).
Field Packing (continued)

- More dependent on weather.
- Requires skilled labor.
- Product in containers are more difficult to cool.
- Less control over quality.
- Cannot apply many postharvest treatments (e.g. waxes, fungicides, etc.).
The Harvesting Process

- **Identify** mature product for harvest using maturity/quality standards.
  - E.g. color, size, shape, firmness, lack of defects, etc.
The Harvesting Process

- **Detach** the product from the plant.
  - pull, cut, twist, shake, etc.
- **Collect** into picking bags, buckets, etc.
The Harvesting Process

- **Accumulate** product in field boxes, bins, trailers, etc.
The Harvesting Process

- **Transport** product away from field to processing/packing facility.
  - Minimize time between harvest & transport.
Minimizing Injury

- **Careful handling** of all produce containers.
- Use **bubble plastic liners and top pads** in field bins.
- **Minimize distance** of forklift movement of field bins to loading point.
- **Grade farm roads** and **restrict travel speed** of transport vehicles relative to road quality.
- Use **good (i.e., “air”) suspension systems** on all trucks and **reduce tire pressure**.
- **Keep all packing equipment clean** to avoid abrasive surfaces.
Physical Damage

- Causes the greatest amount of loss to fresh horticultural products.
- Affects (among other things):
  - Respiration, ethylene production, ripening, and other metabolic processes.
  - Pathogen growth and ability to invade tissue.
  - Tissue discoloration.

Photo courtesy of Steve Sargent
Types of Mechanical Injury

- **Bruises**
  - **Impact:** Drops
  - **Compression:** Excessive weight

- **Cuts, Punctures, Abrasion**
Figures courtesy of Steve Sargent
Figures courtesy of Steve Sargent
Pathology (decay)

- Fungi, bacteria and viruses.
- Preharvest (latent) and postharvest infections.
- Most postharvest infections are a result of rupturing the epidermis of the commodity.
Minimizing Decay

• Importance
  • Commodity Losses
    • Commodities with visible decay are often discarded (especially in wealthy societies).
  • Quality Losses
    • Spores on fruit (e.g. green Penicillium), mold on floral parts, etc.
    • Off-flavors in un-infected parts of a fruit.
    • Accelerated ethylene production, ripening, aging, physiological disorders, etc.
Minimizing Decay

• Importance (continued)
  • Food Safety
    • Mycotoxins (e.g. Aspergillus flavus infection of nuts and dried fruits => aflatoxin).
    • Human pathogens (e.g. E. coli 0157:H7, Salmonella, Listeria, etc.) – Discussed earlier.
Minimizing Decay

- Commodities are Very Resistant to Infection!
  - Out of millions of microorganisms on the surface of produce representing >100,000 different species of fungi,
    - Almost all are unsuccessful at penetrating and infecting tissue.
    - Less than 100 species (10%) are responsible for most postharvest decay.
Commodity Resistance to Decay

- Structural Factors
- Existing Biochemical Defenses
- Physiological & Biochemical Responses
Commodity Decay Resistance

- Structural Factors
  - First line of defense = cutinized epidermis.
    - Few fungi produce enzymes that can break down cutin.
  - Suberin – more common in underground parts, woody stems & wound healing.
  - The above compounds also restrict water movement => inhibits spore germination.
Commodity Decay Resistance

- Existing Biochemical Defenses – If the first line of defense is broken (e.g. windscar, wounding, etc.).
  - Plant tissues already contain many compounds that restrict fungal growth.
    - Examples:
      - Phenolics
      - Alkaloids
      - Acidic pH
Commodity Decay Resistance

- Physiological & Biochemical Responses:
  - Plants respond to attacks (or wounds) by forming **scar tissue containing suberin**.
    - Restricts water loss and repairs the barrier to pathogen entry.
  - Plants respond to attacks by producing compounds toxic to fungi = **phytoalexins**.
    - Many phytoalexins are phenolic compounds.
Breakdown in Defense

- Most postharvest infections arise from ruptures of the epidermis (juice release).
  - Fungal spores will only germinate under high humidities or in the presence of free water. Rupturing the epidermis provides water to germinate.
  - Rupturing the epidermis releases sugars to “feed” spore germination and development.
  - Rupturing the epidermis allows fungi entry into tissue flesh.
Getting Through Defenses

- Invasion through stomates, lenticels and other natural openings.
- Some fungi have the capability to penetrate epidermal cells directly (e.g. anthracnose).
- **Latent infections** – fungi penetrate tissue earlier in development but was inactivated (walled off) but not killed. Continued development resumes as natural defenses break down. E.g. Anthracnose.
  - Difficult to control because infections can occur over a long period of time and the fungi are protected within tissue from postharvest fungicides.
Decay Control Measures

Preharvest decay control

• Prevent latent infections and spore load (inoculum) on fruit coming in from the field.
  - Field sanitation – remove dead/diseased plant parts and wood (e.g., leaf litter, rotting fruit, dead branches, etc.).
  - Chemical applications. Know the biology of the fungi to maximize spray effectiveness.
Decay Control Measures

Postharvest decay control

- Sanitation
  - Clean & disinfect bins, trucks, equipment, packinghouse areas, storage rooms, etc.
  - Use sanitizers (e.g. chlorine) in all recirculated water systems (dump tanks, hydrocoolers, etc.) to reduce pathogen populations.
### Environmental Effects

- **Relative Humidity**
  - High humidity or free water induces spore germination.

- **Temperature**
  - In general, lower temperatures = slower growth.
  - Some fungi grow relatively well at low temperatures.
    - E.g. blue mold (Pencillium italicum) worse during cold storage.
  - Some fungi are killed at low temperatures.
  - High temperatures can also inhibit fungal growth.
  - Storage of chilling sensitive commodities at chilling temperatures = increased decay.
  - Heat treatments (e.g. hot water dips) can kill pathogens without damaging the commodity.
Decay Control Measures
Postharvest decay control

- Atmospheric Compositions.
  - Low oxygen and/or high carbon dioxide concentrations can reduce fungal growth.
    - E.g. use of high (15%) CO$_2$ for strawberries.
    - The real question is how well a particular commodity can tolerate these atmospheres without injury.
Decay Control Measures

Postharvest decay control

- Chemical Treatments.
  - In general, *treatment during spore germination and early development is most effective*. Before spore germination and after establishment within tissue = very difficult to control.
  - **Fumigation** – effective for packed commodities.
    - E.g. Methyl bromide, Sulfur dioxide (grapes) and Carbon monoxide (CO)
  - Water Applications (sprays, dips, etc.). – *Most commonly used methods.*
Decay Control Measures

Postharvest decay control

- Radiation
  - Used mostly for insect quarantine treatments.
  - In general, radiation levels high enough to kill fungi, also damage commodity tissue.

- Growth Regulators
  - E.g. use of 2,4-D to maintain button vitality, use of GA to maintain citrus peel puncture resistance.

- Barriers
  - E.g. fruit wraps, coatings (incl. those with fungicides) help prevent decay organisms from “nesting” (spreading to adjacent fruit).
Maximum Residue Limits

- Maximum Residue Limits (MRLs)
  - Also referred to as Import Tolerances.
  - MRLs are the **maximum residues of specific chemicals (often pesticides) allowed on food.**
    - In the U.S., they are set based on the maximum residues that could be expected if the product was used to the maximum allowable labeled rate.
    - MRLs vary by country & can become a barrier to trade.
  - Expressed as mg of residue/kg product (=ppm).
MRLs Vary by Country

- Growers produce fruits and vegetables for both domestic and export markets.
- CODEX was an attempt to harmonize MRLs for international trade.
  - However, many countries have now developed their own MRL standards.
- Since each country usually sets its own residue tolerances:
  - Following U.S. label rates may still result in MRL violations for different export markets.
Welcome to the International Maximum Residue Level Database

Terms of Use

Users are advised that international regulations and permissible Maximum Residue Levels (MRL) frequently change. Although this International MRL Database is updated frequently, the information in it may not be completely up-to-date or error free. Additionally, commodity nomenclature and residue definitions vary between countries, and country policies regarding deferral to international standards are not always transparent. This database is intended to be an initial reference source only, and users must verify any information obtained from it with knowledgeable parties in the market of interest prior to the sale or shipment of any products. The developers of this database are not liable for any damages, in whole or in part, caused by or arising in any way from user's use of the database.

Please Review the Following Important Information

1. Three rules of the International MRL Database should be noted:

   1. Only those chemicals that have a permanently established EPA tolerance are included.
   2. Foreign market MRLs are included only when an EPA tolerance is in place for the same commodity.
   3. Sometimes US EPA sets tolerances for crop groups rather than for individual commodities (e.g., for stone fruit but not for peaches). These crop group MRLs will be shown for the individual commodities that are members of the crop group. A pop-up note will indicate that the commodity is part of a crop group and that the MRL is set for the group and not the individual commodity.

2. Information about types of MRLs not listed in database.

   The MRL Database exclusively reflects maximum residue levels (MRL) that have been established on a permanent basis under domestic US legislation according to the US Code of Federal Regulation (CFR).

   The following types of MRLs are not included in the database:
   - US import tolerances explicitly noted in the CFR
   - Tolerances for indirect residues
   - Tolerances explicitly noted in the CFR as lacking a current US registration

   For further clarification, please consult the US Code of Federal Regulations - Title 40, Part 180 for pesticide tolerances and Title 21, Part 556 for veterinary drug tolerances.

Select All

1,3-Dichloropropene  Etofenprox  Oxydemeton-methyl
1-Naphthaleneacetamide  Etoxazole  Oxyfluorfen
1-Naphthaleneacetic acid  Etridiazole  Oxytetracycline
2, 6-Disopropynaphthalene (2, 6-DINP)  Famoxadone  Paraquat dichloride
2,4-D  Fenamidine  Pendimethalin
2,4-DB  Fenanimol  Penflufen
Abamectin  Fenbuconazole  Perenoxulam
Acephate  Fenhexamid  Pentaclorobenzene
Acquainocyl  Fenoxaprop-ethyl  Pentachlorophenol
Acetamiprid  Fenpropathrin  Penhexadione
Acetochlor  Fenpyroximate  Permethrin
Acibenzolar-S-methyl  Fentin hydroxide  Phenmedipham
Acriflorfen  Ferbam  Phorate
Alachlor  Fipronil  Phosmet
Aldicarb  Flazasulfuron  Phosphine
Alpha-Cypermethrin  Flocamid  Picloram
Amecobrardin  Florasulam  Piraclofos
Amencryn  Fluzacinam  Pirimiphos-methyl
Amitraz  Flubendiamide  Pallethrin
Asulam  Flucarbazone-sodium  Primisulfuron-methyl
Atrazine  Fludioxonil  Procymidine
Avadexone  Flufenacet  Profenofos
Azinphos-methyl  Flufenoxuron  Profenofos
Azoxystrobin  Flufenpyr-ethyl  Prohexadione calcium
Benthiaralin  Flumetsulam  Prometryn
Benoxacor  Flumiclorac-pentyl  Propachlor
Benthiaralin  Folpet  Propamocarb hydrochloride

Pesticide MRL Database

The query has returned 1 result

Legend
- MRL values in Red italics are more restrictive than US
- All numeric values listed are in parts per million (ppm), unless otherwise noted.
- --- (dashes) indicate that no specific MRL for the commodity or relevant crop group is established. A default MRL may apply for countries that have default MRLs (see Default MRLs section below). Additionally, inadvertent or extraneous MRLs are not included in the database, and the database does not indicate substances that are banned in a country or exempt from requiring an MRL.
- Indicates there is a note to scroll over with your mouse.
- Cod (Codex), EU (European Union), US (United States) and EXP (exporting market) indicate the source of the MRL for countries which defer to other markets' MRL regulations.
- Section 18, Time-Limited, or Regional: indicates that the US MRL is a temporary Section 18, Time-Limited Tolerance, or Regional Tolerance.

Default MRLs
These countries have a default MRL which may be applicable if a specific MRL is not established. However, default MRL regulations vary by country. Before assuming a default MRL applies, the country’s specific regulations governing the default MRLs should be consulted. Country MRL regulations are summarized in market information pages located at the “Market Information” link on the toolbar at the top of this page.

European Union: 0.01 ppm | Argentina: 0.01 ppm | Canada: 0.1 ppm | Iceland: 0.01 ppm | Japan: 0.01 ppm | Malaysia: 0.01 ppm | New Zealand: 0.1 ppm | Norway: 0.01 ppm | South Africa: 0.01 ppm

Buyer Requirements

• Even more confusing can be individual buyer residue tolerances that are more restrictive than country MRLs.
  • These include food processors.
• Such tolerances are not widely distributed, but must be obtained through communication directly with the buyer.
  • Close and frequent communication with buyers is essential.
Thank you!

See the UF Postharvest Information Website for more information

http://irrec.ifas.ufl.edu/postharvest/
