

# General Guidelines for Pest Control in a Fruit Orchard

Xavier Martini

University of Florida, Entomology department

North Florida Research and Extension Center

# Generalist pests

---

Fire ants

Peanut snails

Ambrosia beetles

Citrus root weevil

Orthopter pests

# Red Imported Fire ants

Can kill young trees if nest is too close from the trunk

Can disrupt biological control of scale, psyllid or aphids

Can not be eradicated from a grove

Remove/ destroy nests too close to trees

Food baits might be efficient, but ants need to be active (temperature > 12 °C)

# Red Imported Fire ants

**Figure 1.** (A) Wilting leaves on a declining Satsuma tree, (B) leaf drop and (C) remnants of a fire ant mound around the base of a tree.

# Red Imported Fire ants

## Fire Ant Treatments

An alternative to food baits is injecting boiling Water into ant nest at high pressure.

Dr. Joshua King UCF

# Peanut Snail

- *Bulimulus bonariensis* is an invasive snail native to south American
- Shows potential to negatively impact numerous crops
- Citrus: blocks water and frost irrigation lines. Causes defoliation of younger trees.
- Also a pest in blueberry, pecan...

# Snail infestations

- The snail *Bulimulus sporadicus* was introduced in Florida in 2009. It is an invasive species that originate from west India.
- Gregarious.
- Does not damage plant.
- Tend to aggregate on irrigation emitters and clog them, causing them to stop-up and reduce irrigation efficiency.
- Snails rely on humidity and moisture to complete their life cycle.
- Mostly a problem during dry seasons

# Snail infestations

---

- Keeping the ground around irrigation emitter free of weeds may help reduce their habitat.
- Molluscicide available:
  - Metaldehyde (Deadline M-P)
  - Iron Phosphate + Spinosad (Bug-N-Suggo)
  - Sodium Ferric (Ferroxx)
- Molluscicides need to be applied after irrigation or rain and scattered in small amount.

# Snail infestations

---

- Trapping with
  - Snailer traps® (A)
  - Pyramid style trap - takes advantage of climbing behavior (B)
  - Fermented bread dough is an attractant to snails

# Ambrosia Beetles

- Specialized bark beetles - wood-boring insect
- Play a central role in the nutrient cycling of forest ecosystems
- Evolved with symbiont fungi to invade the nutrient poor xylem
- Adults and larvae feed on this symbiotic “ambrosia” fungus
- Dependent on the presence of this fungus
- Fungus can cause disease in the tree

# Ambrosia Beetles

Mature Ambrosia beetle females emerge after mating:

- Seek a susceptible tree as a new host
- Female creates new gallery in tree xylem to cultivate fungus and oviposit

Most Ambrosia Beetles attack weak trees

- Extreme freezes or over pruning can stress trees

Declining & dying trees encourage more attacks

- Attracted by ethanol release

# Ambrosia Beetles

- Several ambrosia beetles are a treat for nursery and landscape.
- This include the Asian ambrosia beetle *Xylosandrus crassiusculus*
- Transmission of fungal symbiont spores to their host
- Insecticides are of limited activity as beetles spend most or their life in wood.
- Repellents and attractants can be used to manage ambrosia beetles in your operation

*Xylosandrus crassiusculus*

*Xyleborus bispinatus*

*Euwallacea fornicatus*

*Xyleborus volvulus*

Avocados killed by laurel wilt

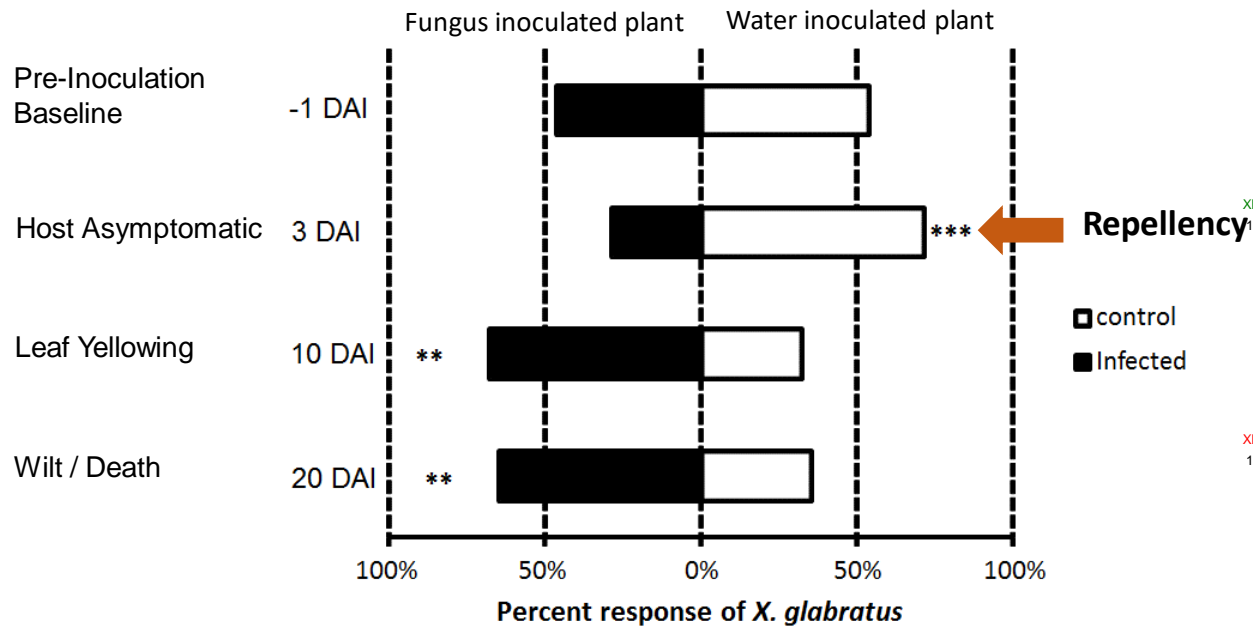

# Ambrosia Beetles

## The Fungus *Raffaella lauricola* Modifies Behavior of Its Symbiont and Vector, the Redbay Ambrosia Beetle (*Xyleborus Glabratus*), by Altering Host Plant Volatile Production

Xavier Martini<sup>1,2</sup> · Marc A. Hughes<sup>3</sup> · Nabil Killiny<sup>4</sup> · Justin George<sup>5</sup> · Stephen L. Lapointe<sup>5</sup> · Jason A. Smith<sup>3</sup> · Lukasz L. Stelinski<sup>2</sup>

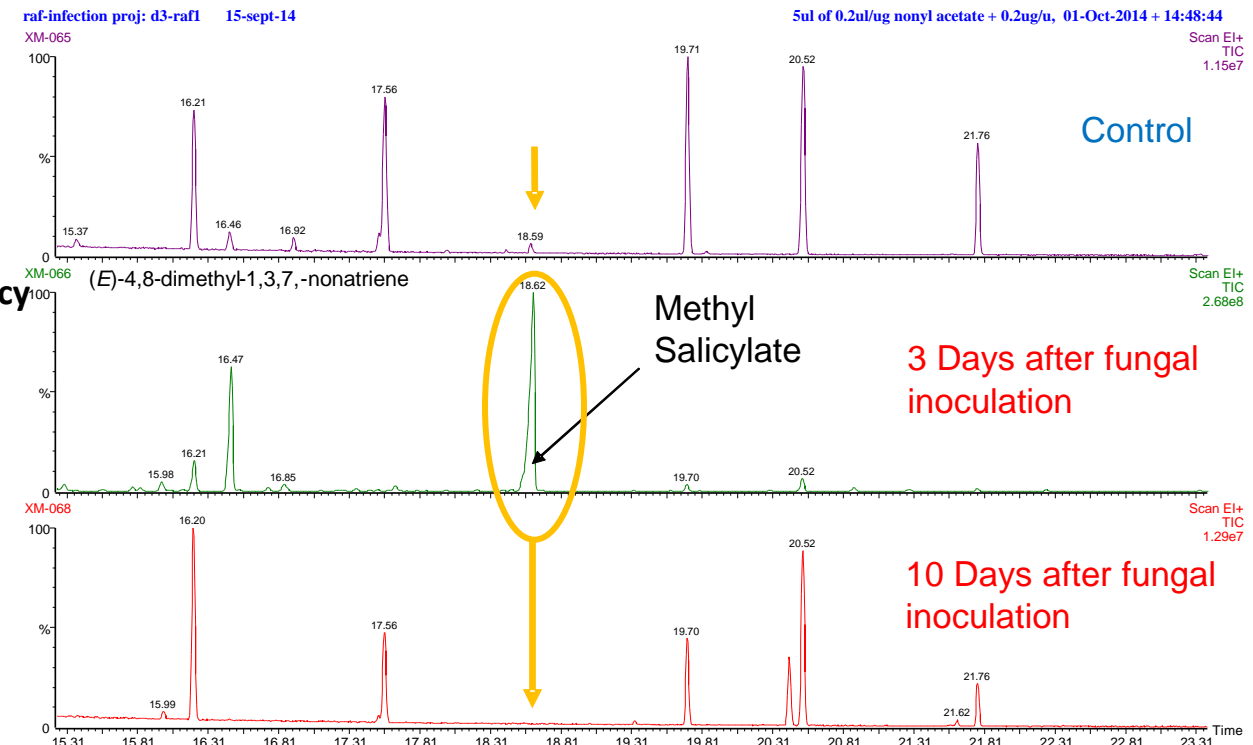

- Methyl Salicylate is a natural repellent

### Stages of laurel wilt disease

DAI = Days After Inoculation with *R. lauricola* fungus

### Swamp bay leaf GC-MS profile 3 DAI

# Ambrosia Beetles

Verbenone showed potential efficacy in repelling *X. glabratus* in preliminary tests

**Fig. 1** Trapping experiment at Wekiwa Springs State Park (WSSP) in Florida. Mean *Xyleborus glabratus* captures  $\pm$  SE over four weeks. Traps consisted of sticky panels (46  $\times$  32 cm) affixed to wooden posts baited with manuka oil. Putative repellent synthetic blends were labelled as pine 1–3 (see table 1) and SPLAT Verb. Traps baited with only manuka oil were positive controls, and negative controls were unbaited traps. Separations of means are listed at weekly intervals. Columns denoted with different letters are statistically different at  $\alpha = 0.05$  according to Tukey's multiple comparisons procedure of treatment least squares means.  $n = 24$ .

Verbenone

# Ambrosia Beetles

SPLAT® with high concentration of Methyl salicylate and verbenone to apply directly on the trunk of redbay trees

J. Appl. Entomol.

## ORIGINAL CONTRIBUTION

### Evaluation of repellents for the redbay ambrosia beetle, *Xyleborus glabratus*, vector of the laurel wilt pathogen

# Ambrosia Beetles

3 colors tested:

- White
- Black
- Silver

3 lures tested:

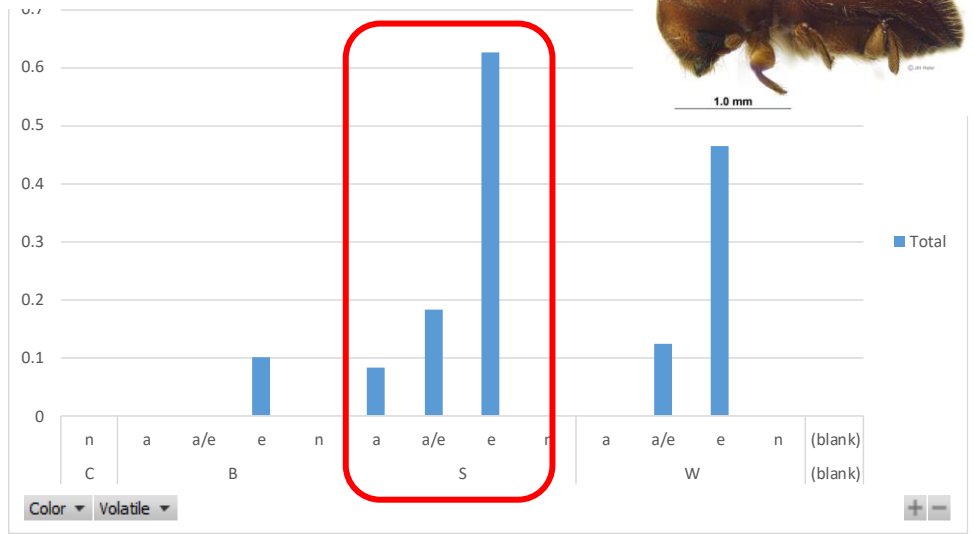

- Ethanol
- Alpha-copaen e
- Ethanol + alpha copaen e

Trap color:  
 C= control  
 B= Black  
 S= Silver  
 W= White

Odor:  
 a=  $\alpha$ -copaene  
 n= no lure  
 e= ethanol  
 a/e= ethanol +  $\alpha$  copaene

*Xylosandrus crassisculus*

*Xyleborus bispinatus*

*Euwallacea fornicatus*

*Xyleborus volvulus*

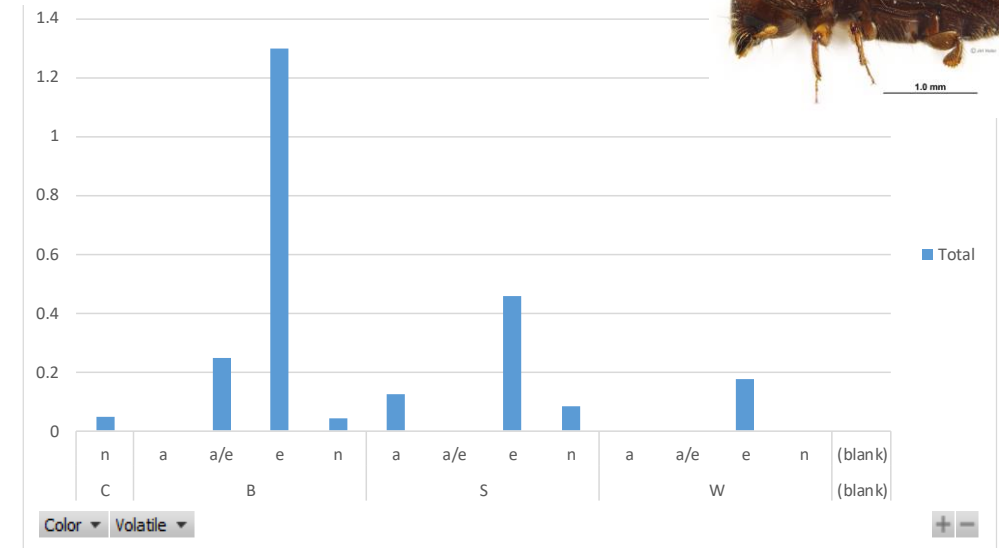

Trap color:  
 C= control  
 B= Black  
 S= Silver  
 W= White

Odor:  
 a=  $\alpha$ -copaene  
 n= no lure  
 e= ethanol  
 a/e= ethanol +  $\alpha$ -copaene

*Xyleborus affinis*

*Xyleborus ferrugineus*

*Xyleborinus saxesenii*

*Xylosandrus compactus*

# Ambrosia Beetles

- For most ambrosia beetle species, the combination silver cover/ Ethanol lures attracted the greatest number of beetle

## Case study: ambrosia beetle infestation in a tung oil orchard

# Ambrosia Beetles

First case of dead trees (12) in June 2023, and spreading

# Ambrosia Beetles

Collection and identification of ambrosia beetles

Recommendations:

- Removal and disposal of all dead trees
- Treatment with pyrethroid of the stump
- Treatment of the two rows nearby the infected trees with verbenone pouch or pyrethroid sprays.

# Ambrosia Beetles

# Ambrosia Beetles

# Citrus root weevil

*Diaprepes abbreviatus*

- Native of Caribbean Islands
- First reported in Florida, in 1964 (in a nursery in central Florida)
- **Recently detected in North Florida (in Jefferson County)**
- Major pest of citrus, ornamental plants, root crops, and sugarcane

# Citrus Root Weevil

Adult weevil colors range from gray to yellow to orange to black

Diaprepes root weevil egg mass on citrus leaf (3—264/mass)

The larvae are white and legless. The head capsule has variable light and dark areas

# Citrus Root Weevil

@Robin Stuart

○ Adult feeds on leaves causing notching along leaf margins

# Citrus Root Weevil

No larvae

**VS**

Larvae

- Larvae feed on the roots, impeding the uptake of nutrients and water
- Severe infestations can result in plant stunting and death
- Root damage can lead to root rot infections caused by pathogens (*Phytophthora sp.*)

Larvae

# Citrus Root Weevil

Channeling of roots caused by weevil larvae

# Citrus Root Weevil

Tedders trap

## How?

Adults can be monitored visually, by scouting the trees or using ground traps

## When?

Early in the morning (Spring and early summer)

# Citrus Root Weevil

## Prevent citrus root weevils!

- Prune dead, discolored, or damaged plant leaves, stems, and branches
- Control of shade and moisture in the soil

- Adjust watering to once a week in the early morning
- Remove overgrown plant leaves and branches
- Rake fallen leaves, branches, and fruit

# Orthopter pests

(A) Broad-winged katydid (*Microcentrum rhombifolium*) and (B) damage on a satsuma fruit

Eastern Lubber Grasshopper

# Orthopter pests

- Keep your orchards clean from weeds
- Adjacent pastures, hay fields, and fallow lands can be significant sources of orthopterans pests
- In case of high-density treatments with Carbaryl-based insecticides or Diamide can be warranted.

Enhancing  
windbreak  
habitat  
attractiveness  
to  
pollinators and  
predators via  
insectary  
plantings

# Enhancing windbreak habitat attractiveness to pollinators and predators via insectary plantings

## Lake Alfred:

Treatment Grove = 5 groups:

Windbreak only (Control)

Windbreak + Wildflowers (blanket flower)

Windbreak + Vines (Florida honeysuckle)

Windbreak + Bushes (buttonbush)

Windbreak + All flowers (Wildflowers + Vines + Bushes)

## Monticello:

Treatment Grove = 4 groups:

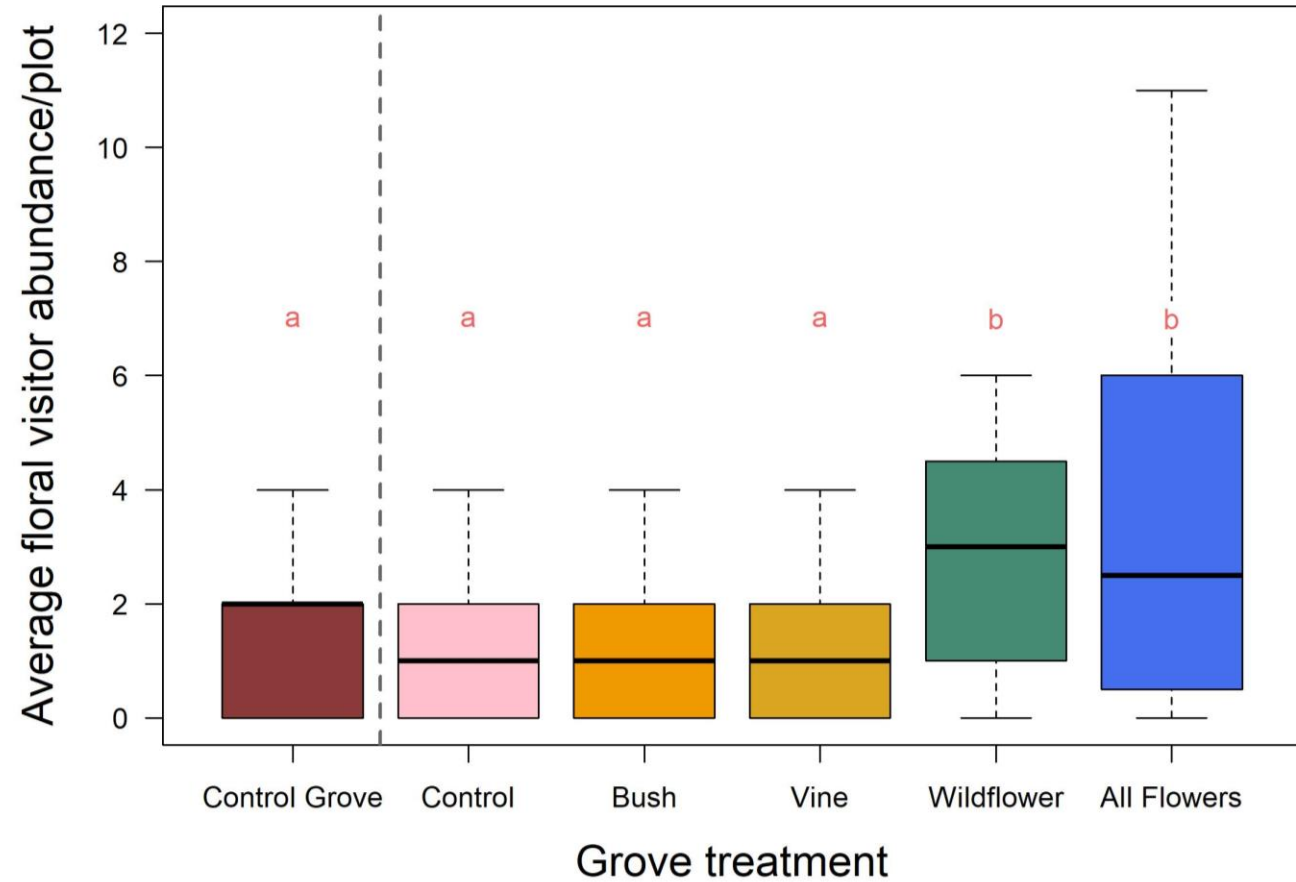

Windbreak only (Control)

Windbreak + Wildflowers (blanket flower)

Windbreak + Vines (Florida honeysuckle)

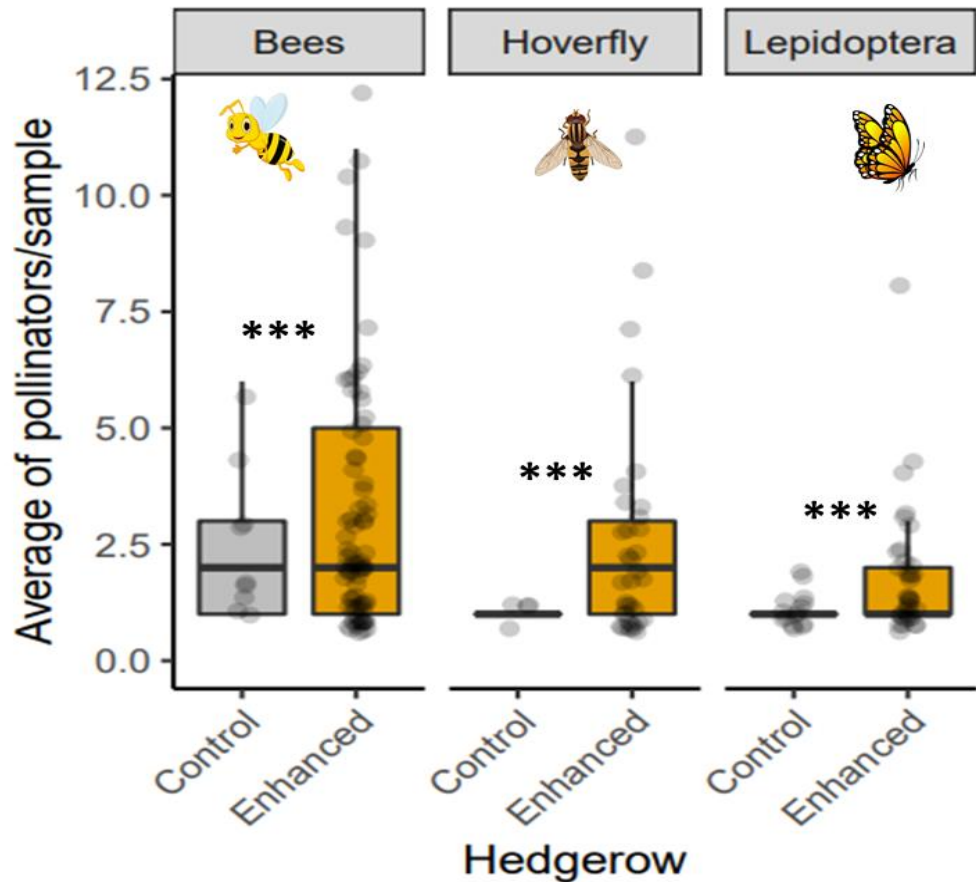

Windbreak + Wildflowers + Vines
